To Whom It May Concern

I (Dr. Deepak) recommend Mr. Yash Varshney on the basis of direct research collaboration. Yash and I co-authored a peer-reviewed paper published in Engineering Reports, a Wiley journal, focused on the optimization of wireless sensor networks using machine learning. That work gave me a close, sustained view of how he thinks, operates, and produces.

WSN optimization is technically unforgiving. It demands precision in experimental design, rigorous validation, and the ability to translate dense quantitative findings into coherent, publishable writing. Yash handled each of these without hand-holding. His contributions to the methodology and results sections were accurate, well-structured, and required little revision before submission. For an early-career researcher, that standard of output is not common.

What I found equally valuable was how he handled the process itself. He flagged ambiguities early, engaged with feedback without defensiveness, and met every deadline we agreed on. Collaborative research breaks down most often at the communication layer; Yash gave me no such problems.

I intend to co-author with him again. This reflects a straightforward assessment that working with him produces good research efficiently.

I strongly recommend Mr. Yash Varshney for any graduate program, fellowship, or research role in engineering or computing.

Dr. Deepak Chandra Uprety
Associate Professor, CS
Noida Institute of Eng. & Tech.
